1. Things That Went Well

During this sprint, we managed to write up tests and set up circle CI and docker for the backend for deployment of the product. Adding an employee was implemented and creating a booking form but with a few bugs yet to be fixed. The wireframe was completed and axios was set up to integrate the backend and frontend together.

2. Things That Could Have Gone Better

Areas of improvement definitely include communication and organization. We need to organize meeting times and ensure everyone comes to them. Watching actual tutorial videos would actually allow us to find information more easily, e.g. setting up for frontend and backend integration. Understanding of the react frontend and axios needs more improvement in order to produce a correct functioning system.

3. Things That Surprised Us

- AWS took longer than expected using terraform due to the amount of things required to setup and was also really slow.

4. Lessons Learned

- Understanding axios is important to know how to link backend and frontend to work correctly
- Unit tests was very useful as it helped in finding bugs for the system to be fixed

5. Final Thoughts

Through this sprint, we learnt that, for frontend, it was important to watch tutorials online and class videos to understand the concepts better. More communication is also required in the team to understand each other situations and help to cover each other. More improvement is to be made in the front end and as this is a problem identified, we will put more focus on this during our next sprint.
